

The 1994 Communications Assistance for Law Enforcement Act (CALEA), would bring no more useful information tapping capabilities than a blind english only speaking spy in iraq. it could only logically be used to violate 1st amendment rights and possibly catch some really stupid people doing not so bright things. those who would participate in any activity deemed inappropriate will quickly start using encryption schemes and other hard to break codes such as stenography. in the end all you will ever be able to achieve with this system is proving that one computer on the internet talks to another, nothing about what was said or who initiated the whole communication sequence. all the major apps will become encrypted (better for security purposes) and all the hackers will resort using virus epidemics to launch their DoS and hacking attacks on various sites. nothing useful besides pushing the crooks further into a barricaded bunker can be achieved.
